

Clear Cache

Data retrieval from a database can often be slow and CPU intensive. For this reason, several in-memory cache stores exist. These stores allow you to temporarily store commonly retrieved data so it's available for subsequent requests without accessing a database.

SupportPro provides a simple CLI command which will clear your configured cache store.

```
docker exec -u www-  
data supportpro php artisan cache:clear
```

```
php artisan cache:clear
```

```
Application cache cleared!
```
