

Plugin Development: Reports

Plugins can define their own report dashboards, which will be visible in the reports section within the operator panel. Plugin reports should be stored in a Reports directory within the plugin.

For more information on developing report dashboards, please refer to: [\[Redacted\]](#)

To register a dashboard, it's the same process as if you build a full report - the main plugin controller constructor must call the registerReportDashboards method with the dashboard classes in an array.

```
public function __construct(){ parent::__construct(); ... $this->
registerReportDashboards([ AddonsPluginsHelloWorldReports
Overview::class,  ]);}
```
