

GDPR Compliance

This guide will explain what GDPR is, the effects of GDPR on users of SupportPro software and the tools available in SupportPro to make complying with it easier.

This guide is specifically tailored to the use of SupportPro, it is not intended to provide you with, nor should it not be used as a substitute for, legal advice. We recommend reading the more in-depth [GDPR guide](#) and you should seek independent legal advice on your status and obligations under the GDPR.

The General Data Protection Regulation (GDPR) is the EU-wide data privacy law that is in effect from 25th May 2018. It was introduced to unify all EU member state's approaches to data regulations. The aim is to give more control to EU citizens over their personal data in terms of what information is shared, where and how it's shared, and protect against organisations using their data irresponsibly.

GDPR applies to all businesses that handle EU citizens' data, even if the business is located out of the EU. There are however differing levels of responsibility based on what you do with the data.

When considering personal data, there are two classes to consider:

- **Data Controller** - states how the personal data is processed and why it is needed.
- **Data Processor** - does the actual processing of the data on behalf of the data controller.

As SupportPro is on-premise software, typically the software runs on your own servers or with a web hosting company. In the former case, where you manage everything, you would be both the data controller and processor. In the latter case, you are still both a data controller and processor, but the web hosting company is also a processor. As a controller, it is your responsibility to ensure that all third party processors comply with GDPR too.

If you run SupportPro for a client or have a third party managing it for you, this adds another processor level to the equation.

It applies to all data concerning individuals (not organisations) and anything that can be considered as personally identifiable information. This includes name, email, and even IP addresses. Pseudonymised personal data may also be subject to GDPR rules, depending on how easy or hard it is to identify whose data it is.

With SupportPro, the following data that is stored in the database and file system can be considered as personal data:

- User profile, including avatars and custom fields data.
- Tickets, messages, attachments and custom fields data.
- Ticket feedback.
- Activity log, email log and failed logins.
- Comments and article ratings.

As the data controller and processor, you must ensure you are handling personal data responsibly.

SupportPro has tools to help you comply with GDPR. Below is a description of the individual rights of GDPR and how SupportPro can help you for each.

We recommend running at least **SupportPro 2.3.1** where improved tools were introduced to better handle data erasure and information requests.

For users running SupportPro 2.3.0 and below, we highly recommend to turn off the '██████████' option, or upgrade to 2.3.1 where this function has been completely removed. If left enabled, in the event of an unexpected error, personal data may be transmit to third-party ██████ in accordance with our ██████.

Individuals have the right to be informed about the collection and use of data, you must provide information about your purposes for processing their data, retention periods and who it will be shared with in your privacy policy and/or terms of service.

A list of the personal data collected in SupportPro can be found above, and should be modified based on your own specific requirements. You should mention if the data is shared with anyone such as a web hosting company or another third party for whatever reason.

For data retention, the ██████████ tool can be used to automatically remove inactive users, tickets and organisation after a certain time.

Individuals have the right to access their personal data. SupportPro has a frontend portal where users can log in, view and update their data.

Individuals can request for their personal data to be erased. In SupportPro, deleting a user account will delete all related personal data including tickets, activity and email logs.

Individuals can request to obtain all the personal data you have of them. SupportPro offers a option which will generate a JSON format file containing all of their personal data.

Individuals can request the restriction (store but not use) of their personal data under certain circumstances, for example if the controller no longer needs the data but the data subject requires it for the defence of legal claims. Such cases should be extremely rare and unlikely, but if the situation ever arises, a user export can be taken as above and the user can then be deleted from the system. The export should be held for as long as needed.

Individuals have a right to stop their data being used for direct marketing. Replying to support tickets or contacting users when there is a need are considered as legitimate interests and allowed, but consent is required for marketing contact.

SupportPro offers a mass email tool as well as the option of emailing users directly, but we advise to not use this for marketing as there is no option to unsubscribe or ask for consent, instead we recommend to use a tool like [REDACTED]. Instead these tools can be used when you need to contact a number of users together for a legitimate interest.
