

System Health

System health is designed to give you a clear insight into the overall health of your SupportPro installation and its hosting environment.

A traffic light system is used to quickly differentiate between healthy and checks which need attention.

- A green symbol indicates that everything is running smoothly.
- An amber symbol indicates a warning, and is something which should be resolved in a non-urgent manner.
- A red symbol indicates an error, and is something that should be investigated and resolved urgently.

Some of the system health checks available are described below:

Name
Free Disk Space
Application Log Error Count
Redirection Rules
Web Server
Email Piping
Outbound Email Queue

Debug Mode

Database Connection

Cron

The health checks run automatically and the results are cached. Use the Refresh button to view up-to-date health data; the Last Run column shows when the health check data was last updated.
